

Your shop floor, one connected system.

A purpose-built operations console for panel & wire-harness contract assembly — proving the costing engine first, then bringing Planning, Procurement, Stores and Quality online under a single job number.

4

modules, one job ID

11

lifecycle stages

3

quality gates

0

infrastructure to set up

— THE SITUATION

You're experts at the build. The pain is the paperwork around it.

Today everything runs on registers and Excel. We don't change how you work — we make it digital, searchable, backed-up and connected.

Slow

Quoting depends on one person's memory.

Fragile

One file, lost rows, no backup.

Invisible

No live view of stock or job status.

Hard to audit

Quality records live on paper.

One record per work order

Moving through known stages, joined by a single job ID — with the owner's costing know-how captured so quoting stops depending on memory.

Tally stays

We connect to your accounting, we don't rebuild it. A free pilot, with a graceful exit if it isn't for you.

— THE CROWN JEWEL

Type a config → get a harness BOM and a price

We prove the riskiest, highest-value piece first — the costing engine. The owner’s pricing logic, captured once and applied consistently.

COST BUILD-UP · illustrative

Material	₹18,000	Wastage 4%	₹720
Labour	₹6,400	Overhead 8%	₹2,010
Margin 18% — the one dial you turn			₹4,880

Quote total ₹32,010

Already working in the prototype

Parse the feeders, assemble the harness, apply rates, return a cost — the thing that makes you say “we can’t go back.”

What we need to firm it up

✓ A 30–45 min costing walkthrough with the owner

— HOW IT ALL CONNECTS

One work order, eleven stages, three gates

The job number ties everything together — approval opens buying, and two quality gates mean material can't move without an inspection record.

One job ID, four modules

Planning, Procurement, Stores and Quality all hang off the same work order — and the Director role sees across all of them on one screen.

— LIVE NOW

Real metrics, and five process tightenings already shipped

NEW

Quality KPIs compute live from QC, inward and dispatch records — fitted to a shop that builds a few dozen units for a handful of clients.

First-pass yield

passed clean first time

Supplier rejection

rework + reject share

On-time delivery

vs committed date

COPQ proxy

cost of poor quality

Illustrative values — each is computed live from the shop's own records.

① **Quoting handshake** — deliberate client approval with reference + date; rejection has a revise path.

② **Build-complete gate** — a job reaches Final QC only when the floor marks the build done.

— NEXT STEPS

A short, low-risk path to a costing engine you can trust

From Ready Systems

- ✓ A 30–45 min costing walkthrough
- ✓ One filled costing sheet
- ✓ 3–5 past orders with quoted prices

From us

- ✓ Validate the engine on your real orders
- ✓ A free pilot — graceful exit if it's not for you
- ✓ On success → Phase 1: the four modules online
